Github URL

Vercel URL

完成的功能

- 清除、複製按鈕
- 翻譯語言下拉選單
- 點擊或拖曳上傳文檔
- 顯示上傳的文檔
- 可以批量翻譯 txt 文檔

未完成的功能

• 因需要 npm docx 檔的翻譯功能未實現

P1:API 來源與功能

• API 網址

https://rapidapi.com/sibaridev/api/rapid-translate-multi-traduction

• API 功能說明:

免費的額度是一天 50 次

用 POST 發送 json 給伺服器後會回傳翻譯結果

o body:

■ from:輸入文字的語言

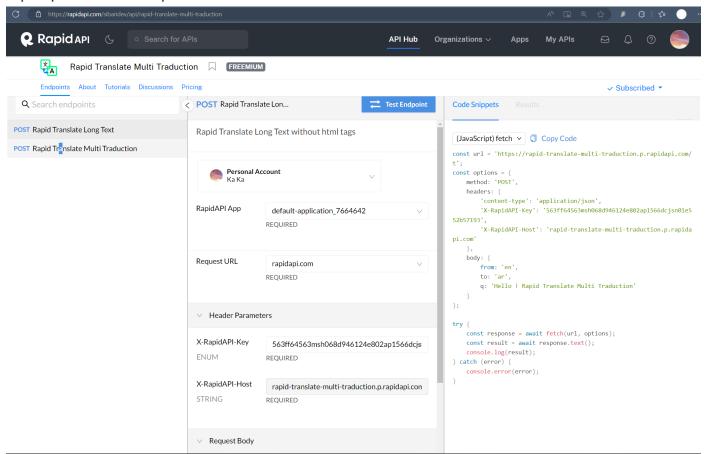

■ to:翻譯結果的語言

■ q:翻譯文本

P2:實作過程

測試 API

• rapidapi 有提供調用 api 的 code

• 但直接使用並沒有成功, console 會報錯

```
(b)
                                                         JS app.js U X 5 index.html U
                                       > w18-api-project > JS app.js > [9] options
const url = "https://rapid-translate-multi-traduction.p.rapidapi.com/t";

▶POST <a href="https://rapid app.js:116">https://rapid app.js:116</a>

 -translate-multi-tra
duction.p.rapidapi.com/t 400
                                         let options = {
                                            method: "POST",
 The payload doesn't match \frac{app.js:118}{app.tour} the content-type header
                                            headers: {
                                               "content-type": "application/json",
                                              "X-RapidAPI-Key": "563ff64563msh068d946124e802ap1566dcjsn01e552b57193",
                                              "X-RapidAPI-Host": "rapid-translate-multi-traduction.p.rapidapi.com",
                                            body: {
                                              from: "en",
                                              to: "zh_tw",
                                         try {
                                            const response = await fetch(url, options);
                                            const result = await response.text();
                                            console.log(result);
                                         } catch (error) {
                                            console.error(error);
```

• 花了一段時間才找到解決方法,需要先將 body 內容轉換成 json 格式伺服器才能讀取

```
body: JSON.stringify({
  from: "en",
  to: "zh_tw",
   q: `Hello!`,
}),
```

```

                                     const response = await fetch(url, options);
                                     const result = await response.text();
                                     console.log(result);
                                    catch (error) {
                                     console.error(error);
```

知道 api 如何運作後,參考了一些配色網站,寫了 html 和 css

JSAPI Project 翻譯

輸入要翻譯的文字	
翻譯結果	
Auto → Amharic 翻譯	Copy Clear

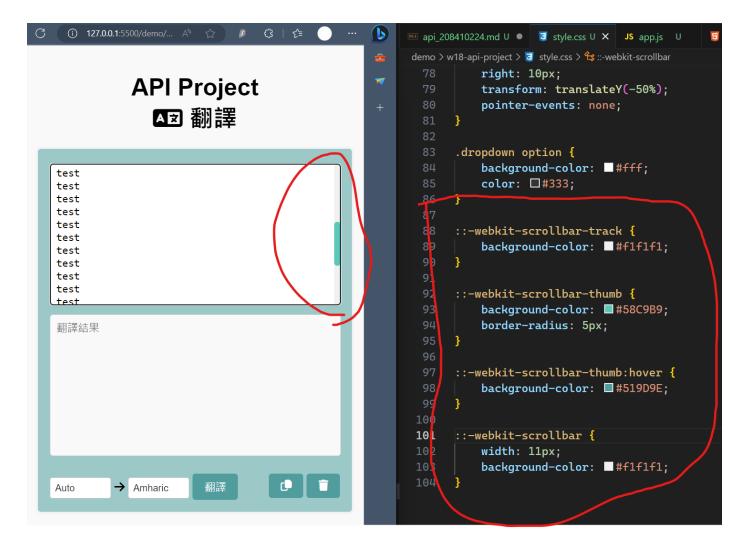

• 到 Font Awesome 找 icon 代替一些文字

API Project

AD 翻譯

輸入要翻譯的文字	
翻譯結果	
Auto → Amharic 翻譯	

• 覺得預設的 scrollbar 很醜,改了樣式

UI 寫完後,輪到 JS

• 先把按鈕功能完成

```
114
ong
         115
               //transBox
ong
         116
               const input = document.querySelector("#input");
ong
               const output = document.querySelector("#output");
         117
ong
         118
               //btns
ong
               const translateBtn = document.querySelector("#translate");
         119
ong
         120
               const clearBtn = document.querySelector("#clear");
         121
               const copyBtn = document.querySelector("#copy");
         122
         123
               const select = document.querySelectorAll("select");
```

• 複製與清除按鈕

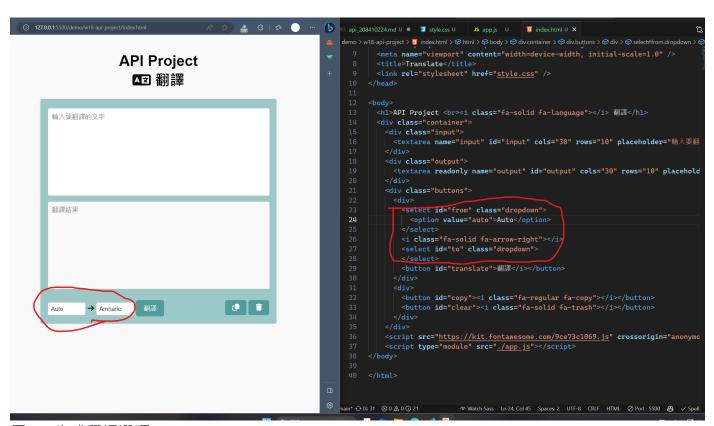

```
T36
137
     clearBtn.addEventListener("click", () => {
        input.value = "";
138
       output.value = "";
139
140
      });
141
      copyBtn.addEventListener("click", () => {
142
        navigator.clipboard
143
144
          .writeText(output.value)
          .then(() => {
145
           console.log("已複製到剪貼板", output.value);
146
147
          })
          .catch(() => {
148
           console.log("複製失敗");
149
150
          });
     });
151
```

• 這個 API 可以翻譯多國語言,做一個 select 選單,讓使用者選擇翻譯語言

```
demo > w18-api-project > JS app.js > ...
   1 ∨ const countries = {
         "am-ET": "Amharic",

  Watch Sass
```

• 用 JS 牛成翻譯選項

```
const select = document.guerySelectorAll("select");
       124
... U
       125
-... U
             document.addEventListener("DOMContentLoaded", () => {
-... U
       126
                select.forEach((item) => {
       127
... U
                  for (const key in countries) {
       128
... U
                    const option = document.createElement("option");
       129
                    option.value = countries[key];
       130
                    option.textContent = countries[key];
       131
toe
                    item.appendChild(option);
       132
                    // console.log(countries[key]);
       133
       134
                });
       135
             });
       136
       137
erm
```

實現翻譯功能

- 在 translate()中呼叫 optionEdit()設定 POST 的內容,並顯示結果。
- 因語言選項顯示的是語言,而 POST 中要使用語言代碼(ex:zh-tw),所以在 optionEdit()中先用 for 找出語言代碼

```
translateBtn.addEventListener("click", () => {
156
157
       translate(input.value);
      });
158
159
160
      const optionEdit = (from, to, text) => {
161
        for (const key in countries) {
          if (countries[key] === from) from = key;
162
          if (countries[key] === to) to = key;
163
164
165
166
        options.body = JSON.stringify({
167
          from: `${from}`,
         to: `${to}`,
168
          q: `${text}`,
169
170
        });
171
        console.log(options.body);
172
173
      };
174
175
      const translate = async (text) => {
176
        if (text.length > 0) {
177
          optionEdit(selectFrom.value, selectTo.value, text);
178
          try {
179
            const response = await fetch(url, options);
180
            const result = await response.json();
181
            console.log(result);
            output.value = result;
182
183
          } catch (error) {
184
            console.error(error);
185
        } else console.log("請輸入文字");
186
187
      }:
```

• 翻譯功能算是完成了,但語言選項為"auto"時,除了回傳翻譯結果還會回傳偵測到的語言種類,因此要另外處理

API Project

AI 翻譯

API Project

AI 翻譯

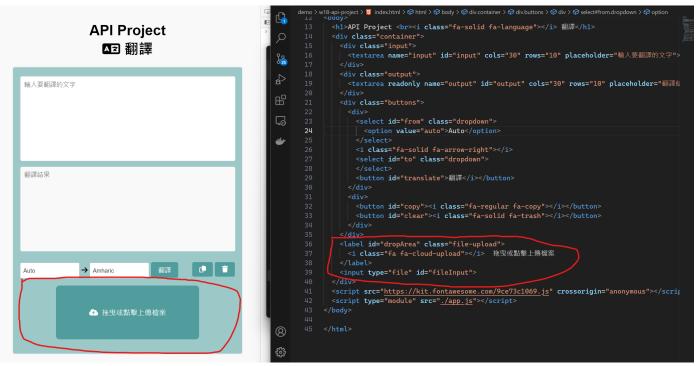

• 在 translate()加入 if 判斷完回傳的數據再顯示

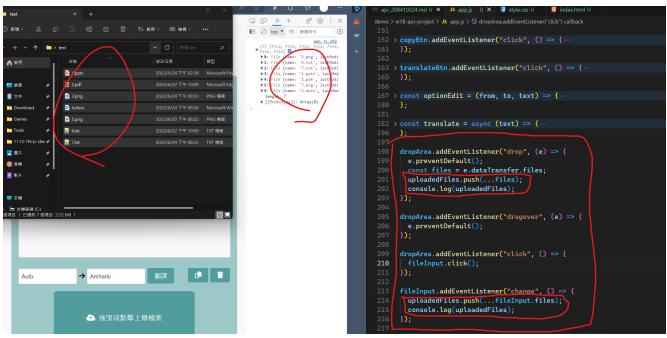

```
const translate = async (text) => {
177
        if (text.length > 0) {
178
          optionEdit(selectFrom.value, selectTo.value, text);
179
180
          try {
            const response = await fetch(url, options);
181
            const result = await response.json();
182
            console_log(typeof result[0]);
183
            if (typeof result[0] === "string") {
184
              output.value = result;
185
            } else output.value = result[0][0];
186
187
          } catch (error) {
            console.error(error);
188
189
        } else console.log("請輸入文字");
190
191
192
```

增加翻譯文檔的功能

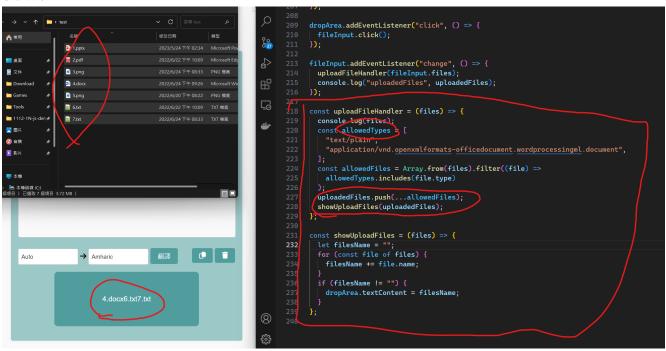

• 做出 UI 和 css

- 加入拖曳和選擇文件的功能
 - 新建一個 global variable uploadedFiles 存放拖曳或點擊上船的文件
 - 。用 e.preventDefault()防止拖曳後跳窗

- 限制文件的種類(txt,docx),並將上傳的文件顯示出來
 - 。 在 uploadFileHandler() 中用 allowedTypes 來篩選,將篩選後的文件放到 uploadedFiles,然 後顯示

。 在 clearBtn 加入清除文件的功能

```
clearBtn.addEventListener("click", () => {
  input.value = "";
  output.value = "";
  dropArea.innerHTML = '<i class="fa fa-cloud-upload"></i> 拖曳或點擊上傳檔案';
  uploadedFiles = [];
});
```

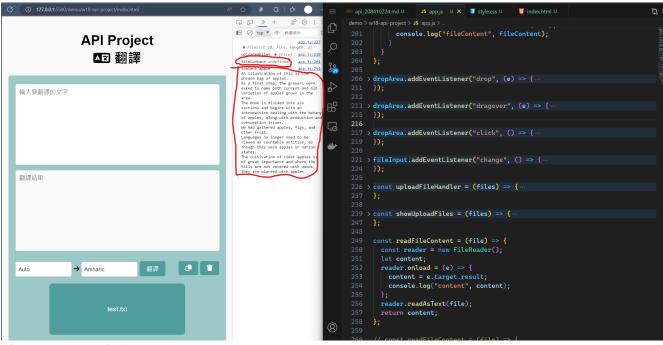

- 讀取文件內容
 - 。 按下翻譯後在 translate()呼叫 readFileContent() 讀取上傳的文件

```
const translate = async (text) => {
  if (text.length > 0) {
    optionEdit(selectFrom.value, selectTo.value, text);
    try {...
  } catch (error) {
    console.error(error);
  }
}

if (uploadedFiles.length > 0) {
  for (const file of uploadedFiles) {
    const fileContent = readFileContent(file);
    console.log("fileContent", fileContent);
  }
}

};
```

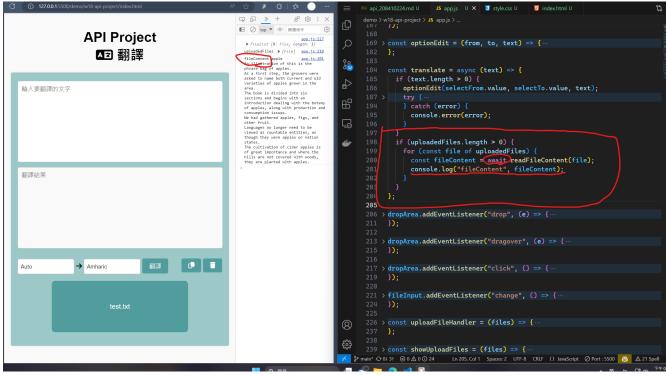

。 在 readFileContent()中有成功 console 出文件內容,但 reader.onload 是非同步執行的,所以 translate()中沒辦法接收在 readFileContent() return 的文件內容

。 使用 promise 改寫 readFileContent()

```
const readFileContent = (file) => {
9
      return new Promise((resolve) => {
0
        const reader = new FileReader();
        reader.onload = (e) => {
2
          const content = e.target.result;
3
          if (content) {
4
            resolve(content);
55
6
        reader.readAsText(file);
8
9
0
```

。 translate()成功取得文件內容

- 下載文件
 - 。 下載功能實作,用 blob 存放翻譯後的內容,建立連結下載並將文件名加上翻譯的語言

```
I api_208410224.md U ● JS app.js U X I style.css U

                                                                                                                       let oto;
if (file.type === "text/plain") {
   blob = new Blob([fileContent], { type: "text/plain" });
   const downloadLink = URL.createObjectURL(blob);
   const linkElement = document.createElement("a");
                                                                                                                         linkElement.href = downloadLink;
const fileName = file.name.substring(0, file.name.lastIndexOf("."));
linkElement.download = `${fileName}_${selectTo.value}.txt`;
                                                                                                     208
209
210
                                                               d T
                                                                                                     211
212
                                                                                                                          URL.revokeObjectURL(downloadLink);
                                                                                                     213
214
                                   test.txt
                                                                                                      217 > dropArea.addEventListener("drop", (e) => {
```

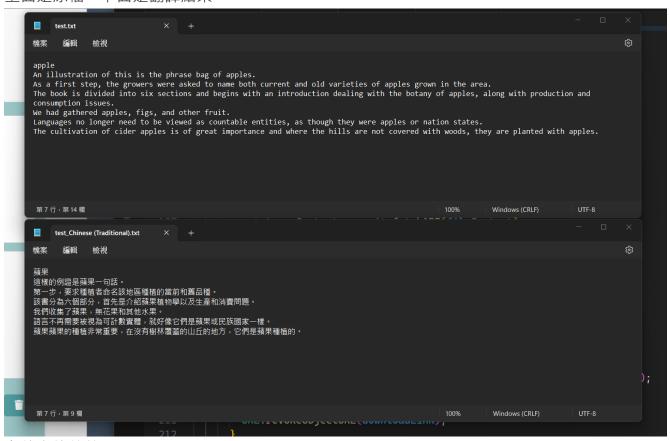

- javascript 沒有內建讀取 docx 的方法,需要使用 npm ,放棄
- 完成翻譯文檔的功能
 - 。 因需要重複使用新增 fetchAPI()

```
270 v const fetchAPI = async (text) => {
        optionEdit(text);
271
        try {
272 ~
          const response = await fetch(url, options);
273
          const result = await response.json();
274
275
          return result;
276 🗸
        } catch (error) {
277
          console.error(error);
278
279
      };
280
```

。 將翻譯的結果與下載功能結合

```

AI 翻譯

心得甘苦談

通過這項作業我更熟悉 api 的使用方法,整個實作過程雖然有碰到一些問題但也學習到了很多,Blob、上傳、下載是都是我沒有學過的方法,花了點時間去爬文,收穫很大。
